

ABSTRACT OF DISCLOSURE

A method, apparatus, and readable medium for presenting an Internet or Intranet accessible patient evaluation system. Medical evaluation forms are presented to users over a transmission channel such that a user at a browser may access previously prepared forms of patients, editing those forms, or enter evaluation data for a new patient. A generator uses form data stored in a configuration database to generate HTML/ASP page documents in which users can view previously entered data or add new data. The interaction between the generator and a configuration module containing the loaded configuration database is dynamic, as when the configuration database changes or is updated the generator is caused to generate new HTML/ASP page documents to correspond to the changed configuration database.
